

Problem Solving (A3)Report

Topic: Climate change

Date:

Name:

1. Identify the Problem

For millions of years humans have been living on Earth, and with the past of time humans have grown in number. In the attempt to cover everyone necessities a lot of incredible things have been created, but a lot of these things have or still are contributing to our home planet's climate change. As a result we are experiencing high temperatures, droughts, poles are melting, fires, more hurricane possibilities, etc.

2. Set The Target

Make people aware of the damage they are causing, because most of the people are ignorant to the damage they can cause to the Earth by not being careful with the use of their common tools. More people aware of the damage they cause, implicates more careful people. This will eventually help to normalize the climate change our planet is experiencing.

3. Analyze The Causes

4. Propose and Implement Countermeasures

Create a place where information can be found, to aware people about climate change and how it is affecting the whole planet and its species. Also, add resources (carbon footprint calculator, alternatives, recommendations, etc) that will guide the people to live a more aware lifestyle.

5. Check/Evaluate

6. Act and/or Standardize
